

Norway blue carbon — integrated priority synthesis

Stock × Risk × Co-benefit, three canonical regions × two habitats

A. Where the carbon is

B. Where the pressure is

C. Co-benefit fingerprint

D. Priority quadrant — Kelp sites

Priority quadrant — Seagrass sites

Panels A–C are regional aggregates (3-region cut: Skagerrak absorbs Oslofjord). Panel D plots individual study sites (n = 31): risk = dredging + akvakultur + platforms within 5 km (haversine), co-benefit = regional MPA share + within-5 km research density + log regional habitat extent. z-scored within ecosystem; small jitter applied so stacked sites are visible. Kelp site stock data unavailable (Ribeiro 2022 pop-genetics) — markers uniform. Seagrass marker size = site carbon stock g C/m² (Gagnon 2024).
